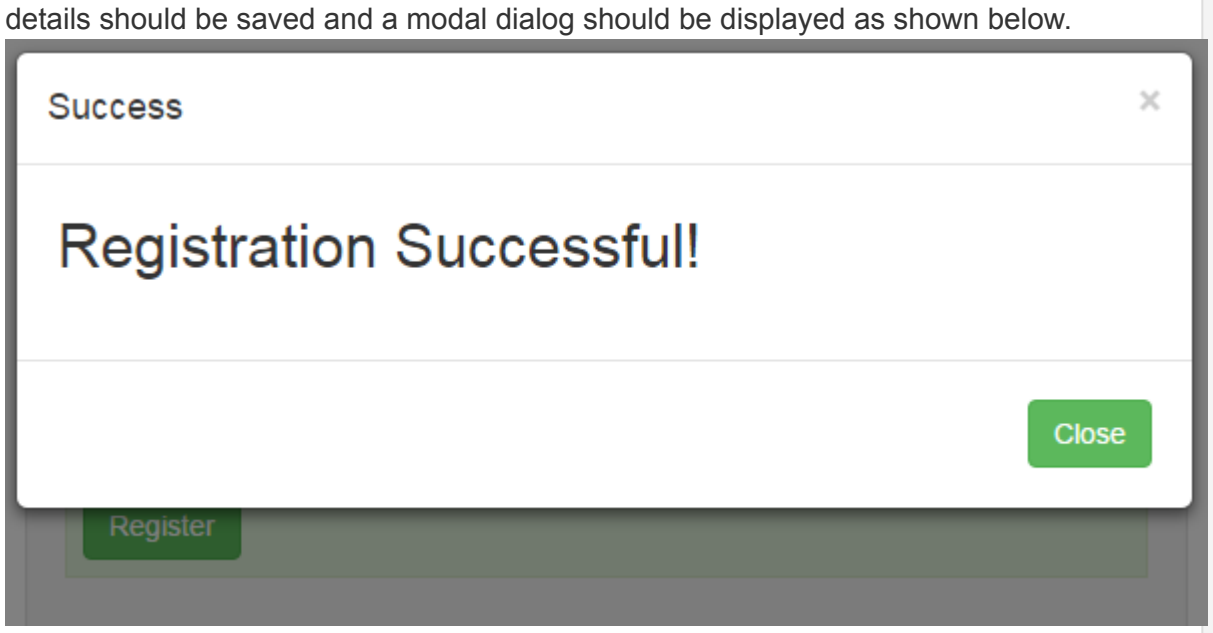
For a new user to register they have to provide
1. Email address
2. Password
3. Confirm password

When all the fields are provided and when the Register button is clicked, the new user details should be saved and a modal dialog should be displayed as shown below.



To achieve this, add an HTML page to EmployeeService project. Name it Register.html. Copy and paste the following HTML and jQuery code.

```
<!DOCTYPE html>
<html>
<head>
   <title></title>
   <meta charset="utf-8" />
   <link href="Content/bootstrap.min.css" rel="stylesheet" />
</head>
<body style="padding-top:20px">
   <div class="col-md-10 col-md-offset-1">
      <div class="well">
         <!--This table contains the fields that we want to capture to register a new user--
>
         <table class="table table-bordered">
            <thead>
               <tr class="success">
                  <th colspan="2">
                     New User Registration
                  </th>
               </tr>
            </thead>
            <tbody>
               <tr>
                  <td>Email</td>
                  <td><input type="text" id="txtEmail" placeholder="Email" /> </td>
               </tr>
```

                    <button type="button" class="close" data-dismiss="modal">
                        &times;
                    </button>
                    <h4 class="modal-title">Success</h4>
                </div>
                <div class="modal-body">
                    <form>
                        <h2 class="modal-title">Registration Successful!</h2>
                    </form>
                </div>
                <div class="modal-footer">
                    <button type="button" class="btn btn-success"
                            data-dismiss="modal">
                        Close
                    </button>
                </div>
            </div>
        </div>
    </div>
    <!--Bootstrap alert to display any validation errors-->
    <div id="divError" class="alert alert-danger collapse">

        <a id="linkClose" href="#" class="close">&times;</a>
        <div id="divErrorText"></div>
    </div>
  </div>
</div>

<script src="Scripts/jquery-1.10.2.min.js"></script>
<script src="Scripts/bootstrap.min.js"></script>

<script type="text/javascript">
    $(document).ready(function () {

        //Close the bootstrap alert
        $('#linkClose').click(function () {
            $('#divError').hide('fade');
        });

        // Save the new user details
        $('#btnRegister').click(function () {
            $.ajax({
                url: '/api/account/register',
                method: 'POST',
                data: {
                    email: $('#txtEmail').val(),
                    password: $('#txtPassword').val(),
                    confirmPassword: $('#txtConfirmPassword').val()
                },
                success: function () {
                    $('#successModal').modal('show');
                },
                error: function (jqXHR) {
                    $('#divErrorText').text(jqXHR.responseText);
                    $('#divError').show('fade');
                }
            });
        });
    });
  </script>
</body>
</html>
```

Please note :

1. The ajax() method posts the data to '/api/account/register'
2. You will find the Register() method in AccountController in Controllers folder
3. AccountController is provided by ASP.NET Web API, which saves data to a local membership database

In our next video we will discuss where the users registration data is stored and all the

When u r doing a ajax request make sure your URL has a absolute address

Anonymous April 25, 2017 at 12:37 AM

if you using MVC then your url should be like this @url.action(action,controller)..or
make a hidden file in view and specify url.
and get that filed val in jquery...

or
if you using webforms then your url should be like this.
url:'xyz.aspx/funtionName',
thank you

sunny July 18, 2017 at 2:31 AM

can you please add the code of accountcontroller

Reply

Replies

Dinesh Kudale August 24, 2019 at 4:32 AM

It is auto-generated code which is already available under Controllers folder --> AccountController.cs file.

Hi I hope you can still see this, but i am still trying to learn how to do all this.
Because I created a Web API project that will be the "Web Service" for my project. My Web API contains the Identity Framework, now I need to create a MVC client project that will connect (Register/Login/Interact) to my Web API Project.

I am aware that i need to have the same model structure as my web api project to be able to access the things i need on my Web API.
My question is, do i need to create my MVC client project with Indvidual User Accounts? or Should I just create a plain MVC project?

Thanks

Regards,
~ Pat

i am getting a following error can anyone please help me {"Message":"The request is invalid.","ModelState":{"":["Passwords must have at least one non letter or digit character."]}}

Reply

Anonymous February 21, 2018 at 2:38 AM

Hi there, try as password: Welcome$01
It should work. There are some rules for the password!
That's why you got the error.

Reply

Unknown March 24, 2018 at 5:21 AM

Could you also make a tutorial on how to change it from uning a LocalDB in the project folder to use a ()external MS SQL Server, i cant get to to work. and since you in the previous episode uses a MS SQL Server for the Employee Data why not continue to use that databse.

Gustavo August 23, 2018 at 5:16 PM

Hi.
My app_data folder is empty, and I have inserted a new user successfully. I dont know where is the probem, I followed all the steps of the video.

Reply

Replies

Dinesh Kudale August 24, 2019 at 4:48 AM

If you click on 'Show All Files' icon which is available in 'Solution Explorer', then you will see database under App_Data folder. This step has already explained by Kudvenkat sir in this video.

Reply

Kevin Alfaro October 18, 2018 at 9:00 PM

Hey, did everything just as the video, even copied the code to my Register.html source but once the Register button is clicked nothing happens, not even the errors show. Any idea of why is this happening?

Reply

Anonymous January 14, 2019 at 11:05 PM

Just Change the Jquery version of the source code to the jquery version you are currently using. This tutorial is using a old version of jquery thats why you are facing this problem.

Reply

Dinesh Kudale August 24, 2019 at 4:39 AM

It is working successfully using Visual studio express 2015 with Kudvenkat's mentioned bootstrap & jquery files. Thanks.

Reply

Dinesh Kudale August 24, 2019 at 5:21 AM

I think that 'modal-sm' class has not required in above Kudvekat sir's code's following line:
class="modal-dialog modal-sm"

Because 'modal-sm' class has not available under 'Content' Folder --> bootstrap.css file.

Unknown September 13, 2019 at 7:13 PM

I need to know, Mr. Venkat. How you were able to create the mdf file? If it was supposed to be available automatically when we created the application, the mdf should be on the App_Data. I apologize if I am wrong, I am new to ASP.NET Web API. I mainly worked on basic C# and SQL so I don't know much about web security.

Reply

Unknown November 4, 2019 at 2:37 AM

i have followed your youtube videos and now this doc about registration. But it still says modelstate is invalid. password and confirmpassword do not match. but they do...
