In this video we will discuss implementing logout functionality for ASP.NET Web API. This is continuation to Part 25. Please watch Part 25 from ASP.NET Web API tutorial before proceeding.

To log out the user from the application all we have to do is remove the Access token from the client browser session storage. Here is what we want to do.
1. Include a **Log Off** button on the Data.html page
2. When the **Log Off** button is clicked remove the access token from client browser session storage and redirect the user to the login page.

Load Employees Log Off

ID	First Name	Last Name	Gender	Salary
1	Mark	Hastings	Male	60000
2	Steve	Pound	Male	45000
3	Ben	Hoskins	Male	70000
4	Philip	Hastings	Male	45000
5	Mary	Lambeth	Female	30000
6	Valarie	Vikings	Female	35000
7	John	Stanmore	Male	80000

HTML for the **Log Off** button. Include the following HTML on the Data.html page immediately below the Load Employees button.

```
<input id="btnLogoff" class="btn btn-success pull-right"
      type="button" value="Log Off" />
```

In the script section include the following jQuery click event handler for the Log Off button as shown below.

```
$('#btnLogoff').click(function () {
    sessionStorage.removeItem('accessToken');
    window.location.href = "Login.html";
});
```

There are 2 ways for the user to Log Off

1. By closing the browser window. Since we are storing the access token in browser session storage, the access token will be lost when we close the browser window.
2. By clicking the **"Log Off"** button, which explicitly removes the access token from the browser session storage.

If you do not want to loose the access token, when the browser is closed store the access token in browser local storage instead of session storage. The way you store, retrieve and remove items from local storage is exactly the same as storing, retrieving and removing items from session storage, except that you use localStorage object instead of sessionStorage object.

At this point, you may have the following questions.

We are only deleting the access token on the client. We are not invalidating or deleting the access token from the server side. If someone can intercept the access token, will they not be able to use that access token and gain access to the system.

The straight answer to the question is YES. If someone is able to intercept the access token, they will be able to impersonate and gain access to the system. However, most of the systems that use access tokens, work over SSL (Secure Socket Layer), which inhibits intercepting access tokens.

Should we invalidate or delete access tokens from the server

No, there is no need to invalidate or delete access tokens from the server. Access token lives on the client, and it is enough if we remove it from the client. Another good practise is to set the expiry of the access token to as short time as practically possible depending on the nature of your application.

Hi Venkat,

Thanks for this blog.
I have been reading your many times.I appreciate your documentation too.

Here I would like to add one more input about session storage and local storage.

Value stored in sessionStorage can not be accessible in new tab. if you have hyperlink in page which open your page in new tab, you can not have sessionStorage in new tab/window.

Thanks,
Arpan Shah

You can write some kind of jQuery code that keeps validating the token every 10-30 seconds through AJAX call.

Hi Venkat Sir,

Thanks for all your fruitful videos.
You are the dictionary of C# concepts. Thanks for sharing all these knowledge.

Thanks,
Pankaj Gupta
